

# BLACKBELT COMMANDOS

## Security Workforce Management Platform

### Detailed Client Feature Requirement & Functional Explanation

|               |                                                        |
|---------------|--------------------------------------------------------|
| PREPARED FOR  | BlackBelt Commandos Security Systems Ltd               |
| DOCUMENT TYPE | Client-facing feature requirement                      |
| SOURCE BASIS  | Original 2-page client requirement sheet               |
| SCOPE         | Business features only - no technology or architecture |

### DOCUMENT INTENT

This document explains the client-requested features in clear business language so that management, operations and end users can validate the expected product behavior. It intentionally excludes software technologies, architecture, database design, APIs and implementation choices.

## OVERVIEW

# 1. Executive Summary

BlackBelt Commandos Security Systems Ltd requires a workforce management product focused primarily on field-force operations. The requested solution covers attendance using geofencing, incident reporting, daily activity tracking, emergency SOS, QR-based patrolling, employee requests, live field-officer tracking, employee-data verification and management monitoring.

The client has identified four field roles: Security Guard, Supervisor, Security Officer and Field Officer. In addition, in-office Management users and the Control Room require operational views and verification capabilities.

## Core business objective

Create a controlled and visible operating process in which field staff can mark attendance, perform assigned activities, prove patrol movement, report emergencies and submit operational information, while supervisors and management can monitor, verify and act on that information.

## 1.1 Requested User Groups

| User group                   | Primary responsibility                      | Requested access focus                                                                    |
|------------------------------|---------------------------------------------|-------------------------------------------------------------------------------------------|
| Security Guard               | Perform assigned security duty              | Attendance, SOS, leave, payslip, live activity image, QR patrol                           |
| Supervisor                   | Manage approximately 15-20 guards           | Guard features plus team visibility, guard check-in, daily checklist, escalation contacts |
| Security Officer             | Act as site in-charge                       | Guard and supervisor capabilities plus daily site report summary                          |
| Field Officer                | Responsible for city-level field operations | Salary advance, bill submission, employee-detail submission, live tracking                |
| Management / In-office Staff | Employee administration and verification    | Office attendance, employee database, employee-data status and verification               |
| Control Room                 | Monitor field operations                    | Live tracking screen of field officers with filtering                                     |

## 1.2 Feature Groups

- Attendance and shift visibility
- Emergency and incident communication
- Daily activity evidence
- Patrol presence confirmation
- Employee requests and self-service
- Supervisor team monitoring and daily checks
- Site-level operational reporting
- Field Officer submissions and live tracking
- Employee database and submission verification

- Control-room location monitoring and filtering

**OPERATING MODEL**

## 2. Role and Responsibility Model

The client requirement describes a role hierarchy in which responsibilities increase from Guard to Supervisor to Security Officer, while the Field Officer has a separate city-level field responsibility. Management and the Control Room provide office-side monitoring and verification.

### 2.1 Role Inheritance as Requested

The source requirement explicitly states that the Supervisor should have all Security Guard features, and the Security Officer should have all Security Guard and Supervisor features. This means the system experience should be role-aware, but higher operational roles should retain the relevant lower-role capabilities required by the client.

**Important scope note**

The original client document does not define detailed permission rules for every feature, approval authority, or data-visibility boundary. Those items should be confirmed during final requirement approval and are therefore not assumed in this document.

## ROLE DETAIL

### 3. Security Guard Features

The Security Guard is the primary field user. The client expects the guard application to support attendance, emergency communication, employee self-service, task evidence and physical patrol confirmation.

#### SG-01 Punch In / Punch Out Using Geo-fencing

**Purpose:** Allow the guard to record duty start and duty end while confirming that the attendance action is associated with the required work location.

**Expected behavior:** The guard opens the attendance action and performs Punch In at the beginning of duty and Punch Out at the end. The product should use the configured work-area geofence as the location condition for the attendance action. The attendance record should clearly indicate the result to the guard.

**Business value:** Reduces location ambiguity in attendance and provides management with a location-based record of duty reporting.

**To be confirmed:** Exact geofence radius, early/late punch window, exception handling when GPS is unavailable, and whether supervisor approval is needed for exceptions.

#### SG-02 SOS Emergency Button

**Purpose:** Provide the guard with an immediate way to alert the Control Room during an emergency or unsafe situation.

**Expected behavior:** The SOS control should be easy to find and activate. Once activated, the Control Room should be informed that the guard has raised an emergency alert. The event should identify the guard so that the Control Room knows who requires attention.

**Business value:** Improves response visibility during emergencies and provides a direct connection between field personnel and the Control Room.

**To be confirmed:** Who receives the alert, whether the alert repeats until acknowledged, emergency categories, response time expectations, and cancellation/false-alarm handling.

#### SG-03 Leave Request

**Purpose:** Allow guards to submit a leave request through the application instead of relying only on calls or manual communication.

**Expected behavior:** The guard should be able to create and submit a leave request. The request should remain visible with its current status after submission so that the guard can understand whether it is pending or has been acted upon.

**Business value:** Creates a documented employee request process and improves visibility for workforce planning.

**To be confirmed:** Leave types, leave balance display, approval role, attachment requirements, rejection reasons, cancellation rules and roster impact.

#### SG-04 Payslip View

**Purpose:** Allow guards to access their payslips from the application.

**Expected behavior:** The guard should have a payslip area where available salary slips can be viewed. The client requirement specifically asks for viewing; any broader payroll processing is outside the stated source requirement.

**Business value:** Reduces dependency on manual payslip distribution and gives employees direct access to their salary documents.

**To be confirmed:** Payslip source, available history, download permission, password protection and acknowledgement requirement.

## ROLE DETAIL

# 3. Security Guard Features - Continued

## SG-05 Activity-Based Live Image Upload

**Purpose:** Provide visual evidence that a required activity was completed at the required time.

**Expected behavior:** The client example is a meter reading at a specific time. When an activity requires image proof, the guard should capture the image live from the application at the time of the activity. The client specifically states that attachment/gallery upload should not be available for this type of evidence.

**Business value:** Improves confidence that operational evidence was captured during the actual duty activity rather than selected later from an existing gallery.

**To be confirmed:** Which activities require images, image retention period, whether a reading/value must also be entered, image quality requirements, and what happens when the camera is unavailable.

## SG-06 QR Code Patrolling

**Purpose:** Confirm that guards physically visit prescribed areas within the work site during patrol duty.

**Expected behavior:** QR codes are expected to be placed at different locations inside the work area. During patrol, the guard uses the application to scan the QR code at each required point. Each successful scan marks presence at that location and provides evidence that the guard has visited the prescribed area.

**Business value:** Provides a simple, auditable patrol trail and helps management verify movement across critical areas of the site.

**To be confirmed:** Number and location of QR checkpoints, required sequence, patrol frequency, patrol time windows, missed-check handling and damaged-QR fallback process.

## 3.1 Guard Shift Requirement

The client states that there are three shift timings and that each Security Guard will have fixed shift timings. The product should therefore show the guard the applicable assigned shift clearly enough for the guard to understand when attendance and duty activity are expected.

### Shift configuration to confirm

The source requirement does not specify the exact three shift times, grace periods, weekly-off rules, break periods, shift swaps or overtime handling. These details should be obtained from the client before final

sign-off.

### 3.2 Example Guard Duty Journey

1. Guard opens the application and confirms today's assigned duty/shift.
2. Guard reaches the work location and performs geofenced Punch In.
3. Guard performs scheduled daily activities and captures live images where required.
4. Guard conducts patrol rounds and scans QR checkpoints across the work area.
5. If an emergency occurs, the guard activates SOS to inform the Control Room.
6. At the end of duty, the guard performs Punch Out.
7. Outside immediate duty actions, the guard can submit leave requests and view payslips.

#### ROLE DETAIL

## 4. Supervisor Features

The Supervisor manages a team of approximately 15-20 Security Guards. The client requires the Supervisor to receive all Security Guard features and additional team-management functions.

### SP-01 All Security Guard Features

**Purpose:** Allow the Supervisor to perform the Security Guard functions where those activities are relevant to the Supervisor role.

**Expected behavior:** The Supervisor role should include the client-requested Guard capabilities such as geofenced attendance, SOS, leave, payslip viewing, activity evidence and QR patrol where applicable.

**Business value:** Keeps the operational experience consistent and ensures the Supervisor can also perform field-duty functions.

**To be confirmed:** Whether every Guard feature is active for every Supervisor assignment or only when the Supervisor is scheduled for that activity.

### SP-02 Reporting Guards List

**Purpose:** Give the Supervisor a clear view of the guards assigned under the Supervisor.

**Expected behavior:** The Supervisor should see a list of the Security Guards reporting to them. The list should make it practical to identify team members and understand who is expected under the Supervisor's responsibility.

**Business value:** Creates a clear reporting relationship and reduces dependence on manual guard lists.

**To be confirmed:** Which guard details are visible, how temporary/replacement guards appear, and whether lists are grouped by site or shift.

### SP-03 Check-In Security Guards

**Purpose:** Allow the Supervisor to record or confirm guard check-in as requested by the client.

**Expected behavior:** The Supervisor should be able to select the relevant reporting guard and perform the permitted check-in action. The system should clearly associate the action with the guard and the

Supervisor who performed it.

**Business value:** Provides a supervisory attendance-control option where the client's operations require the Supervisor to check guards in.

**To be confirmed:** Whether this replaces or supplements the guard's own punch, what evidence is required, when the Supervisor may use it, and whether an approval is required.

## SP-04 Everyday Checklist

**Purpose:** Ensure that recurring supervisory readiness activities are completed each day.

**Expected behavior:** The Supervisor should receive an everyday checklist containing operational checks. The client examples include Uniform Check and Morning Meeting. Each checklist item should be markable so that completion status can be seen.

**Business value:** Creates consistency in daily supervision and provides evidence that basic readiness activities were performed.

**To be confirmed:** Final checklist items, whether comments/photos are required, checklist completion deadline and action for failed items.

## SP-05 Escalation Contact List

**Purpose:** Give the Supervisor quick access to the people who should be contacted when an issue requires escalation.

**Expected behavior:** The Supervisor should have an accessible escalation contact list in the application. The list should identify the relevant contacts required for operational escalation.

**Business value:** Reduces time spent searching for contact information during operational issues.

**To be confirmed:** Contact hierarchy, site-specific contacts, after-hours contacts, ownership for updating numbers and whether one-touch calling is required.

### ROLE DETAIL

## 5. Security Officer / Site In-Charge Features

The client defines the Security Officer as the Site In-Charge responsible for the smooth functioning of services. This role receives the Guard and Supervisor capabilities and adds site-level daily reporting.

### SO-01 Security Guard and Supervisor Capabilities

**Purpose:** Allow the Site In-Charge to perform and supervise the same operational activities defined for the Guard and Supervisor roles.

**Expected behavior:** The Security Officer should have access to the relevant Guard and Supervisor functions, including reporting-guard visibility, guard check-in, everyday checklist and escalation contacts, in addition to field-duty functions.

**Business value:** Provides one site-level role with visibility and operational control over the service activities described by the client.

**To be confirmed:** Exact site-level permission boundaries and whether the Security Officer can act on all supervisors/guards within the site.

## SO-02 Reporting Guard Visibility

**Purpose:** Provide the Security Officer with visibility of guards associated with the site reporting structure.

**Expected behavior:** The client repeats the requirement that reporting Security Guards should be listed. The Security Officer should therefore be able to view the relevant reporting guard population required to manage the site.

**Business value:** Supports day-to-day site supervision and helps the Site In-Charge understand manpower availability.

**To be confirmed:** Whether the list includes all guards at the site, only direct reports, supervisors and temporary replacements.

## SO-03 Guard Check-In

**Purpose:** Allow the Security Officer to perform the guard check-in function described by the client.

**Expected behavior:** The Security Officer should be able to use the permitted check-in action for relevant Security Guards. The action should remain attributable to the Security Officer who performed it.

**Business value:** Provides site-level oversight for guard reporting and attendance-related operational handling.

**To be confirmed:** Same check-in policy clarifications required for Supervisor check-in.

## SO-04 Everyday Checklist and Escalation Contacts

**Purpose:** Ensure that the Site In-Charge can carry out the recurring checks and contact/escalation activities required to keep the site operating smoothly.

**Expected behavior:** The Security Officer should have access to the same daily-checklist concept and escalation contact list described for the Supervisor role.

**Business value:** Improves consistency of site readiness and escalation handling.

**To be confirmed:** Whether the Security Officer has a separate checklist from the Supervisor and whether completion by one role satisfies the other.

## SO-05 Daily Site Report Summary

**Purpose:** Provide the Site In-Charge with a daily summary of site operations.

**Expected behavior:** The Security Officer should have a Daily Site Report Summary covering the information the client expects to review for the site. The original requirement requests the summary but does not define its exact fields.

**Business value:** Creates daily site-level operational visibility and gives management a consistent point of reference for service status.

**To be confirmed:** Exact report contents, preparation time, responsible person, approval requirement, distribution list, historical access and whether the report is generated automatically or entered manually.

### ROLE DETAIL

## 6. Field Officer Features

The client states that a Field Officer is responsible for an entire city and should be given geofencing for the entire city. The Field Officer also performs business submissions and is subject to live tracking.

### FO-01 City-Level Geo-fencing

**Purpose:** Associate the Field Officer's work activity with the city or operating area for which the officer is responsible.

**Expected behavior:** The Field Officer should be assigned a city-level work area. The application should recognize that the Field Officer's responsibility is broader than a single site and should support the city-level geofence described by the client.

**Business value:** Creates a geographical operating boundary aligned with the Field Officer's responsibility.

**To be confirmed:** Exact city/area boundary definition, handling of travel outside the city, multiple-city responsibility and whether alerts are needed when outside the area.

### FO-02 Salary Advance Request Form

**Purpose:** Allow the Field Officer to submit a salary advance request using a structured form.

**Expected behavior:** The application should provide a Salary Advance Request Form that can be completed and submitted. The request should remain traceable so the Field Officer can see that the submission has been made.

**Business value:** Replaces informal/manual requests with a recorded employee-request process.

**To be confirmed:** Required form fields, eligibility rules, approval stages, approved amount, repayment handling and status values.

### FO-03 Bill Submission

**Purpose:** Allow the Field Officer to submit bills related to field work.

**Expected behavior:** The Field Officer should have a Bill Submission function where bill information can be entered and submitted. The source document does not define bill categories or approval flow, so this feature should remain configurable according to client finance policy.

**Business value:** Improves control and traceability of field-expense submissions.

**To be confirmed:** Bill categories, required fields, proof/receipt attachment rules, approver, rejection/send-back behavior and payment-status visibility.

### FO-04 Employee Details Submission

**Purpose:** Allow Field Officers to submit employee details for management verification.

**Expected behavior:** The Field Officer should be able to capture and submit employee details. These submissions must then become available on the Management side for review and status handling.

**Business value:** Creates a structured flow from field-level employee data collection to office verification.

**To be confirmed:** Exact employee fields, required documents, duplicate handling, whether edits are allowed after submission and which fields are mandatory.

## FO-05 Live Tracking of Field Officers

**Purpose:** Allow authorized office/control-room users to see the live location of Field Officers during the relevant operating period.

**Expected behavior:** The client explicitly requests live tracking of Field Officers. Each Field Officer should therefore appear in the management/control-room tracking view with a current or recent location status sufficient for operational monitoring.

**Business value:** Improves visibility of city-level field resources and allows the Control Room/Management to understand Field Officer location during operations.

**To be confirmed:** Tracking hours, location refresh frequency, off-duty privacy, consent/notice requirements, what happens when GPS/network is unavailable and who is allowed to see location history.

### OFFICE-SIDE DETAIL

## 7. Management / In-Office Staff Features

The Management side is intended for in-office staff. The client requires geofenced office attendance, an employee database and a verification/status process for employee information submitted by Field Officers.

### MG-01 Office Punch In / Punch Out Using Geo-fencing

**Purpose:** Allow in-office staff to record their attendance using the same location-based principle requested for field attendance.

**Expected behavior:** Authorized office users should be able to Punch In and Punch Out within the applicable office geofence. The action should clearly record attendance against the office work location.

**Business value:** Provides a consistent location-based attendance process for office staff.

**To be confirmed:** Office locations, shift rules, geofence radius, remote-work exception and approval handling.

### MG-02 Employee Database

**Purpose:** Provide Management with a central place to view employee records required for the client's operations.

**Expected behavior:** The Management side should contain an Employee Database where employee information can be searched and reviewed. The database should include the employee submissions received from Field Officers after they enter the verification process.

**Business value:** Creates one controlled source for employee information and reduces dependence on scattered manual records.

**To be confirmed:** Complete employee data fields, search/filter requirements, edit permissions, historical records and who owns final employee data quality.

### MG-03 Employee Data Status and Verification

**Purpose:** Allow Management to review employee details submitted by Field Officers and take a clear

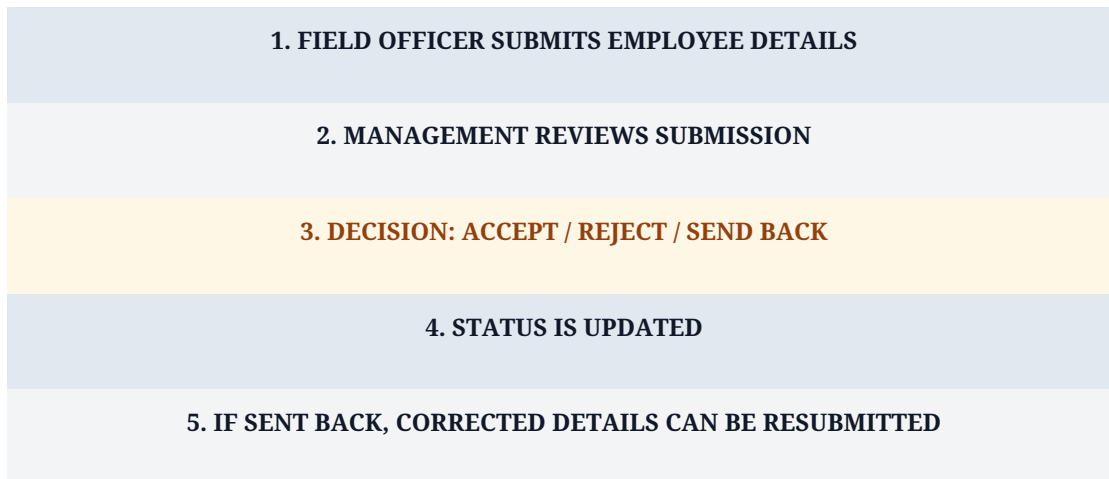

decision.

**Expected behavior:** Each submitted employee record should have a status. Management should be able to review the details and choose one of the actions specifically requested by the client: Accept, Reject, or Send Back. The resulting status should be visible so the submission does not remain ambiguous.

**Business value:** Introduces a controlled office-verification process for employee records coming from the field.

**To be confirmed:** Reviewer role, reasons/comments required for Reject or Send Back, resubmission behavior, whether individual fields or the whole record are approved, and whether accepted data becomes immediately active.

## 7.1 Employee Submission Lifecycle

### MONITORING

## 8. Control Room Live Tracking

The client separately calls out a live tracking screen for all Field Officers in the Control Room. Management should be able to filter the tracking view according to its choice.

### CR-01 Live Field Officer Tracking Screen

**Purpose:** Provide the Control Room with a consolidated view of Field Officers operating in the field.

**Expected behavior:** The Control Room should have a screen that shows all Field Officers who are available for live tracking. The view should make it possible to identify individual officers and understand their current/recent location for operational monitoring.

**Business value:** Gives the Control Room a real-time operational picture of city-level field staff and supports faster coordination.

**To be confirmed:** Map provider/layout, location refresh interval, stale/offline status, whether route history is needed, and who can access previous location history.

### CR-02 Tracking Filters

**Purpose:** Allow Management/Control Room users to narrow the live tracking screen to the officers they

want to monitor.

**Expected behavior:** The client specifically requests filtering. The tracking screen should therefore provide filters that allow users to reduce the displayed Field Officers according to agreed business criteria.

**Business value:** Makes a large live-tracking screen usable by allowing the Control Room to focus on relevant resources.

**To be confirmed:** The source document does not specify the exact filters. Likely filter options must be confirmed by the client rather than assumed.

### Source limitation

The original client document requests a live tracking screen and filtering but does not define dispatch, route replay, event timelines, SLA timers, chat, call logs or emergency-response workflow. Those should not be treated as approved requirements unless the client separately confirms them.

## 8.1 Conceptual Information to Display

For requirement validation, the minimum tracking concept is: identify the Field Officer, show location status, and allow filtering. Any additional information such as phone number, assigned city, current task, battery level, last-update time, route history or status indicators should be finalized with the client before inclusion in the approved scope.

### FEATURE CONSISTENCY

## 9. Cross-Role Functional Behavior

Although the client requirement is role-based, several functions connect multiple roles. The following behavior explains how the requested features relate to one another without adding new scope.

| Business flow           | Starts with                         | Office/next-role visibility                           | Expected outcome                                 |
|-------------------------|-------------------------------------|-------------------------------------------------------|--------------------------------------------------|
| <b>Attendance</b>       | Guard / office user Punch In-Out    | Supervisor / relevant management visibility as agreed | Duty attendance recorded with geofence condition |
| <b>Emergency</b>        | Guard activates SOS                 | Control Room is informed                              | Emergency alert reaches office monitoring        |
| <b>Patrol</b>           | Guard scans site QR codes           | Supervisory review as agreed                          | Presence at prescribed patrol points is recorded |
| <b>Daily checks</b>     | Supervisor completes checklist      | Security Officer / management visibility as agreed    | Daily readiness activity is recorded             |
| <b>Employee details</b> | Field Officer submits employee data | Management verifies                                   | Accepted, Rejected or Sent Back status           |
| <b>Field tracking</b>   | Field Officer location is tracked   | Control Room / Management view                        | Current field-officer location can be monitored  |

## 9.1 Status Visibility

Where a feature involves a submission or decision, the user should not be left uncertain about what happened. For example, employee-data submissions must show whether they have been Accepted, Rejected or Sent Back because those status actions are explicitly requested by the client. For other requests such as Leave, Salary Advance and Bill Submission, the client has requested the submission function but has not defined the final status model; this must be confirmed.

## 9.2 Live Evidence Principle

The strongest evidence rule in the source document applies to activity-based image uploading. Where the client requires live image proof, the application should use live capture and should not allow an existing attachment/gallery image to satisfy that activity.

## 9.3 Geographic Scope Principle

The client describes two different location concepts: site/work-area geofencing for attendance and city-level geofencing/live tracking for Field Officers. These should remain separate business concepts because the Guard works at a specific work area while the Field Officer is responsible for the broader city.

### OPERATIONAL EXAMPLES

# 10. End-to-End Business Scenarios

## 10.1 Normal Guard Shift

8. Guard reports to the assigned work area for the fixed shift.
9. Guard completes Punch In using the work-area geofence.
10. Guard performs required activities during the shift.
11. When an activity requires image proof, the guard captures the image live in the application.
12. Guard performs patrol rounds and scans the installed QR codes at prescribed locations.
13. If an emergency occurs, the guard uses SOS so the Control Room is informed.
14. At the end of the shift, the guard completes Punch Out.

## 10.2 Supervisor Morning Process

15. Supervisor opens the reporting-guards list.
16. Supervisor confirms the relevant reporting guards and performs permitted guard check-in actions where required.
17. Supervisor completes the everyday checklist, including the client examples of uniform check and morning meeting.
18. If an operational issue requires help, the Supervisor uses the escalation contact list.

## 10.3 Employee Details Verification

19. Field Officer enters and submits employee details.
20. The submission becomes available on the Management side.
21. Management reviews the submitted information.
22. Management chooses Accept, Reject or Send Back.
23. The employee-data status is updated accordingly.

## 10.4 Control Room Monitoring

- 24. Field Officers are represented on the live tracking screen.
- 25. The Control Room/Management applies filters to focus on required Field Officers.
- 26. If a Guard raises SOS, the Control Room is informed of the emergency event as required by the client.

### TRACEABILITY

## 11. Complete Feature Responsibility Matrix

| Feature                                | Guard | Supervisor | Security Officer | Field Officer         | Management                             | Control Room          |
|----------------------------------------|-------|------------|------------------|-----------------------|----------------------------------------|-----------------------|
| Geofenced Punch In/Out                 | Yes   | Yes*       | Yes*             | City geofence context | Yes - office                           | -                     |
| SOS                                    | Yes   | Yes*       | Yes*             | Not specified         | Receives/ monitoring role not detailed | Control Room informed |
| Leave Request                          | Yes   | Yes*       | Yes*             | Not specified         | Approval not specified                 | -                     |
| Payslip View                           | Yes   | Yes*       | Yes*             | Not specified         | -                                      | -                     |
| Live Activity Image                    | Yes   | Yes*       | Yes*             | Not specified         | -                                      | -                     |
| QR Patrolling                          | Yes   | Yes*       | Yes*             | Not specified         | -                                      | -                     |
| Reporting Guards List                  | -     | Yes        | Yes              | -                     | -                                      | -                     |
| Guard Check-In                         | -     | Yes        | Yes              | -                     | -                                      | -                     |
| Everyday Checklist                     | -     | Yes        | Yes              | -                     | -                                      | -                     |
| Escalation Contacts                    | -     | Yes        | Yes              | -                     | -                                      | -                     |
| Daily Site Report Summary              | -     | -          | Yes              | -                     | Review not specified                   | -                     |

\* The client states that the Supervisor has all Security Guard features and the Security Officer has all Security Guard and Supervisor features. “Not specified” means the original requirement does not explicitly assign that feature to the role.

### WHY THESE FEATURES MATTER

## 12. Business Value by Feature Area

**01. Attendance visibility** - Geofenced Punch In/Out connects attendance with the expected physical work location.

**02. Emergency communication** - SOS creates a direct emergency notification path from field staff to the Control Room.

**03. Operational proof** - Live image capture provides time-of-activity visual evidence and prevents the use of existing gallery files for designated activities.

**04. Patrol verification** - QR scanning confirms that guards reach prescribed physical checkpoints.

**05. Supervisor control** - Reporting-guard lists, check-in and daily checklists give Supervisors a practical operational view of their team.

**06. Site oversight** - The Security Officer receives site-level responsibility and a Daily Site Report Summary.

**07. Field administration** - Field Officers can submit salary advance requests, bills and employee details while operating at city level.

**08. Office verification** - Management can maintain the employee database and decide whether Field Officer submissions are Accepted, Rejected or Sent Back.

**09. Location awareness** - Live Field Officer tracking gives the Control Room and Management visibility of field resources.

**10. Operational focus** - Tracking filters prevent the Control Room from having to view every Field Officer at once.

### OPEN POINTS

## 13. Client Confirmations Required Before Final Scope Sign-Off

The source document defines the main features but does not provide several detailed operating rules. The following items should be confirmed with the client so that the approved scope matches actual business practice rather than assumptions.

| Area       | Confirmation required                                                                                                                  | Status |
|------------|----------------------------------------------------------------------------------------------------------------------------------------|--------|
| Attendance | Exact three shift timings; geofence radius; grace period; offline/GPS failure handling; manual correction; supervisor check-in policy. | TBC    |
| SOS        | Recipients; acknowledgement process; escalation contacts; response timing; cancellation or drill handling.                             | TBC    |
| Leave      | Leave types; approval hierarchy; documents; status values; cancellation and leave balance requirements.                                | TBC    |
| Payslips   | Source of payslip data; number of months/years visible; view-only versus download.                                                     | TBC    |
| Live Image | Which activities require image proof; any accompanying reading/comment;                                                                | TBC    |

| Area                  | Confirmation required                                                                                       | Status |
|-----------------------|-------------------------------------------------------------------------------------------------------------|--------|
|                       | image retention and exception handling.                                                                     |        |
| QR Patrol             | Checkpoint count; patrol sequence; required rounds; timing; missed checkpoint handling; damaged QR process. | TBC    |
| Supervisor Checklist  | Final checklist items; mandatory evidence; completion time; failure/escalation rule.                        | TBC    |
| Escalation Contacts   | Contact levels; site-specific numbers; after-hours contacts; responsibility for updates.                    | TBC    |
| Daily Site Report     | Exact fields; who prepares/reviews; submission time; recipients; historical access.                         | TBC    |
| Salary Advance        | Required form fields; approval levels; amount rules; repayment/status handling.                             | TBC    |
| Bills                 | Bill categories; required proof; approval flow; reject/send-back behavior; payment status.                  | TBC    |
| Employee Details      | Full field list; documents; mandatory fields; duplicates; correction/resubmission rules.                    | TBC    |
| Employee Verification | Who can Accept/Reject/Send Back; mandatory reasons; effect of acceptance on employee database.              | TBC    |
| Field Tracking        | Tracking hours; refresh rate; location history; privacy/off-duty behavior; no-signal handling.              | TBC    |
| Control Room Filters  | Which filters are required - the client document requests filters but does not name them.                   | TBC    |

## APPROVAL AID

## 14. Client Feature Validation Checklist

This checklist can be used in a client review meeting to confirm that the requirement explanation matches the client's intention before detailed implementation scope is finalized.

- ☐ 01. Security Guards can Punch In and Punch Out using work-area geofencing.
- ☐ 02. SOS activation informs the Control Room.
- ☐ 03. Security Guards can submit leave requests.
- ☐ 04. Security Guards can view payslips.
- ☐ 05. Activities can require live-camera image capture, with gallery/attachment upload blocked for those activities.
- ☐ 06. Security Guards can scan QR codes placed at different work-area locations to mark patrol presence.

- 07. Three shift timings are supported and each Security Guard has fixed shift timings.
- 08. Approximately 15-20 Security Guards can report to a Supervisor.
- 09. Supervisors receive the Security Guard features.
- 10. Supervisors can view their reporting Security Guards.
- 11. Supervisors can perform the requested guard check-in function.
- 12. Supervisors have an everyday checklist including uniform check and morning meeting examples.
- 13. Supervisors have an escalation contact list.
- 14. Security Officers act as Site In-Charge and receive Guard/Supervisor functions.
- 15. Security Officers have a Daily Site Report Summary.
- 16. Field Officers are associated with city-level responsibility/geofencing.
- 17. Field Officers can submit Salary Advance Requests.
- 18. Field Officers can submit bills.
- 19. Field Officers can submit employee details.
- 20. Field Officers are available for live tracking.
- 21. In-office Management users can Punch In/Out using geofencing.
- 22. Management has an Employee Database.
- 23. Management can review employee details submitted by Field Officers.
- 24. Management can Accept, Reject or Send Back employee-data submissions.
- 25. The Control Room has a live tracking screen for Field Officers.
- 26. Management/Control Room can filter the live tracking view.

#### IMPORTANT

## 15. Scope Boundaries of This Document

This document deliberately explains only the features found in the original client requirement. It does not convert optional ideas, industry practices or design suggestions into approved client requirements.

### 15.1 Not Defined in the Original Client Requirement

- Payroll calculation or salary processing
- Roster planning or automatic replacement management
- Biometric or facial-recognition attendance
- Incident severity levels, investigation workflow or SLA model
- Automatic dispatch of responders
- Advanced analytics or AI recommendations
- Client portal
- Route replay or historical movement analytics
- General chat or messaging module
- Exact notification channels such as SMS, WhatsApp or email
- Exact report/KPI definitions
- Approval hierarchy for Leave, Salary Advance and Bill Submission
- Detailed compliance, document-verification or employee-eligibility rules
- Any software technology, architecture, API, database or cloud implementation decision

**Approval principle**

Any feature beyond the client's original requirement should be added only after explicit client confirmation and scope approval.

**CONCLUSION**

## 16. Final Requirement Summary

The requested BlackBelt Commandos product is a role-based workforce operations application designed to improve attendance visibility, patrol verification, emergency communication, field activity evidence, employee submissions and management monitoring.

At the field level, Security Guards perform geofenced attendance, SOS, leave, payslip viewing, live activity-image capture and QR patrol. Supervisors add reporting-guard visibility, guard check-in, everyday checklists and escalation contacts. Security Officers act as Site In-Charge and add a Daily Site Report Summary. Field Officers handle city-level responsibility, salary advance requests, bills, employee-detail submissions and live tracking. Management maintains employee information, verifies Field Officer submissions through Accept/Reject/Send Back actions and uses office geofenced attendance. The Control Room receives Field Officer live-tracking visibility with filtering and is informed when SOS is activated.

**Recommended next client action**

Review Section 13 with the client and close the listed TBC items. After those confirmations, this feature document can become the agreed business-functional baseline for scope approval.

### Source Traceability

Source: BlackBelt Commandos Security Systems Ltd - original two-page requirement document supplied by the client. This detailed explanation preserves the requested roles and features and marks unspecified operating rules as “To be confirmed.”

# Business Feature Addendum

This addendum adds the important business-functional areas from the expanded BRD that were not fully explained in the earlier client feature PDF. It intentionally excludes development technologies, APIs, databases, infrastructure and programming details.

## A. Workforce Planning & Coverage

### Roster Planning

Create daily, weekly and monthly duty rosters by client, site, post and shift. Published assignments can be acknowledged by employees, and planning conflicts should be visible before duty starts.

### Coverage Board

Show required posts as filled, open, at-risk, late/no-show, replacement pending or overstaffed so Operations can identify service gaps quickly.

### Replacement Workflow

When leave, absence or no-show creates an open shift, eligible replacements can be shortlisted using availability, skill, distance, fatigue/overtime and site permission. Supervisor or Officer makes the final approved selection.

### Roster Exceptions & Lock

Flag double booking, overlap, missing acknowledgement, no-show and credential-expiry risks. After an approved payroll/billing cut-off, later changes use a controlled correction process.

## B. Employee Verification, Eligibility & Compliance

### Employee Verification Queue

Field Officer employee submissions move through Submitted, Under Verification, Accepted, Rejected or Sent Back. Reasons and comments remain visible so corrections can be resubmitted clearly.

### Duplicate Detection

Potential duplicate employee records can be flagged using available identifiers such as mobile, government-ID reference, bank account or UAN/ESI information for human review.

### Deployability / Eligibility

Where adopted by BlackBelt, only employees meeting required geography/licence, verification, training, fitness, qualification and document-validity conditions should be treated as deployable. Overrides require authorization, reason and approval.

### Credential Expiry

Track upcoming or expired antecedent, training, medical, identity-card, licence-linked or client-mandated records and notify responsible teams.

### Training / Medical / ID Status

Maintain operational status of required training, fitness and physical ID-card lifecycle while restricting sensitive details to authorized users.

## C. Advanced Attendance Controls

### Attendance Evidence & Exceptions

Attendance should retain employee, assignment, site/post, capture time, receipt time, location/accuracy and relevant integrity context. Low-quality location or policy failures create visible exceptions.

### Offline Attendance

At approved weak-connectivity sites, a punch may be captured offline and later synchronized while preserving original capture and receipt times. Duplicate submissions must not create duplicate attendance.

### Attendance Correction

A correction never erases the original punch. The requested correction, reason, evidence, requester, approver and resulting status remain traceable.

### Late / No-Show Alerts

After configured grace, late or missing attendance alerts the responsible Supervisor/Officer and can trigger an open-shift/replacement action.

### Attendance Close

Before payroll handoff, each day should resolve to approved duty, leave, weekly rest, holiday, absence or exception so unresolved records are visible before lock.

## D. Tasks, Handover & Daily Reporting

### Configurable Checklists

Authorized users can define site/post/role/shift checklists such as uniform, grooming, briefing, manpower, equipment and special instructions.

### Task Evidence

A task can require text, selection, numeric reading, signature, live image or creation of an incident when a critical item fails.

### Scheduled Activities

Tasks/checklists can be due at shift start, fixed time, patrol checkpoint, event or recurring schedule.

### Missed Critical Task Alert

Incomplete critical tasks can alert the Supervisor, Officer or other configured role after the allowed time window.

### Shift Handover

Where required, outgoing and incoming staff can record pending issues, keys/equipment, important observations and acknowledgement.

### Automated Daily Activity Report

The DAR can be compiled from attendance, coverage, patrol, task, incident and handover records. The Security Officer reviews and approves instead of retyping the same information.

## E. Incident, SOS & Control-Room Lifecycle

### Structured Incident Report

Capture category, severity, site/post, occurrence/discovery time, people/assets affected, narrative and configured mandatory information.

### Incident Evidence

Where permitted, attach live photo/video/audio, location, witnesses and related documents.

### Incident Lifecycle

Track Submitted, Acknowledged, Assigned, In Progress, Contained, Closed and Reopened states with clear ownership and timestamps.

### Incident SLA & Escalation

Use configured acknowledgement, dispatch, containment and closure targets. Warn before breach and escalate after breach according to severity/site/category.

### Corrective Action

For relevant incidents, record investigation, root cause, corrective/preventive action, owner, due date and verification.

### SOS Lifecycle

SOS moves from Triggered to Delivered, Acknowledged, Response Dispatched, Safe/Escalated and Closed. If data delivery fails, show the approved emergency fallback process.

### Drill Mode

Test SOS events are clearly marked as drills so training does not distort real emergency metrics.

## F. Control Room Command & Dispatch

### Unified Event Queue

Prioritize active SOS, high-severity incidents, missed critical patrols, tracking interruptions and dispatch tasks in one operational queue.

### Live Field Officer Map

Show authorized Field Officers with filters such as city, officer, duty status, location freshness, assignment and incident status.

### One-Action Acknowledgement

Control Room operators can acknowledge an event quickly; operator and acknowledgement time are recorded.

### Dispatch

Assign an eligible Field Officer/responder with instructions, priority and target response time. Suggested nearest responders remain advisory.

### Communication Log

Record operational calls, messages, instructions, status updates and failed contact attempts against the event.

### Automatic Escalation

Unacknowledged or breached critical events move through the configured escalation chain.

### Control Room Shift Handover

Unresolved events transfer between operators/shifts without losing ownership, communication or SLA history.

## G. Employee Requests, Payroll & Financial Controls

### Coverage-Aware Leave

Approvers can see leave impact on the roster. Approved leave can make a shift at-risk/open and initiate replacement handling.

### Salary Advance Workflow

Capture amount, reason, eligibility information, proposed recovery and approval status. Approved recovery information can pass to the organization's payroll process.

### Bill Verification

Field Officer bills move from submission to Operations verification and Finance approval/rejection, with payment reference/status recorded.

### Duplicate Bill Review

Potential duplicate bills can be flagged using available number, image, amount, date or vendor patterns for review.

### Attendance / Payroll Reconciliation

Compare approved roster/attendance information with payroll inputs and highlight unresolved differences before final close.

### Payslip Governance

Only one authoritative payslip per employee/pay period should be released, with duplicate/import exceptions resolved by the responsible team.

## H. Management Dashboards, Reports & Governance

### Exception Dashboard

Show unfilled posts, no-shows, late punches, attendance exceptions, missed checkpoints, expired credentials and overdue approvals.

### Operations Dashboard

Show coverage, attendance quality, patrol adherence, incidents, SOS, DAR status and Field Officer visit performance by authorized hierarchy.

### Drill-Down

Authorized users can move from a KPI to supporting site, shift, employee or event records while keeping consistent filters.

### Scheduled Reports

Generate approved daily, weekly and monthly operational reports with delivery history.

### Core KPIs

Recommended measures include post fill rate, on-time attendance, no-show rate, patrol completion, incident acknowledgement/resolution time, SOS acknowledgement, DAR timeliness and attendance exception rate.

### Standard Reports

Include manpower/coverage, attendance exceptions, patrol/missed checkpoint, incident/open action, SOS audit, DAR/monthly service, employee eligibility/expiry, leave/advance/bill/payroll reconciliation and Field Officer visit reports.

### Audit History

Record important create, edit, approve, reject, export, role-change and sensitive-access events so actions remain attributable.

### Controlled Access & Privacy

Access is limited by role, geography, client, site and assignment. Sensitive employee information requires restricted visibility. Routine Field Officer tracking stops after authorized duty ends.

### Client Portal - Future Phase

A future client view can provide tenant-isolated, read-only access to approved coverage, patrol, DAR and selected incident/SLA information for the client's own sites.

# I. Client Decisions Required Before Final Scope Sign-Off

1. Exact three shift timings, grace periods, breaks and weekly-rest rules.
2. Geofence radius and location-accuracy rules by site.
3. Whether offline attendance is allowed and at which sites.
4. When Supervisor check-in is permitted and who approves attendance corrections.
5. Which sites/activities require live selfie or live-camera evidence.
6. Incident categories, severity levels and acknowledgement/dispatch/closure SLAs.
7. Control Room staffing model, escalation chain and emergency fallback process.
8. Which Field Officers are tracked, tracking interval and authorized duty windows.
9. Required employee fields/documents and final HR/Compliance verification ownership.
10. Salary advance eligibility, limits, approval and recovery rules.
11. Bill categories, limits, receipt requirements and Finance approval rules.
12. Daily Site Report fields, approval cut-off and client-visible information.
13. Required languages for field users.
14. Final credential/compliance records to track and reminder periods.
15. Which reports and fields may be exposed to clients in a future client portal.

**Completion statement:** With this addendum appended, the client-facing PDF covers the original client requirement and the additional business-functional areas from the expanded BRD, while keeping technical implementation details out of the client document.
